

Social Media and Mental Health: A Quantitative Study

Abstract: Social media usage exceeds three hours per day among adolescents.

Adolescents experience increased anxiety and depression symptoms.

This study surveys 200 university students about their social media habits.

We measured psychological well-being using standardized scales.

Results show a strong positive correlation between screen time and anxiety.

The correlation coefficient was $r=0.72$, $p<0.001$, indicating significance.

Instagram and TikTok showed the highest association with negative outcomes.
